

An aerial night view of a city, likely New York City, with a network of glowing blue lines and dots overlaid on the image, suggesting a global or interconnected theme. The lines form a complex web across the cityscape, with some lines connecting to specific points of interest like the Empire State Building. The background shows the city lights and the dark sky with some clouds.

Version History and Updates

v1.2

October 5th, 2017

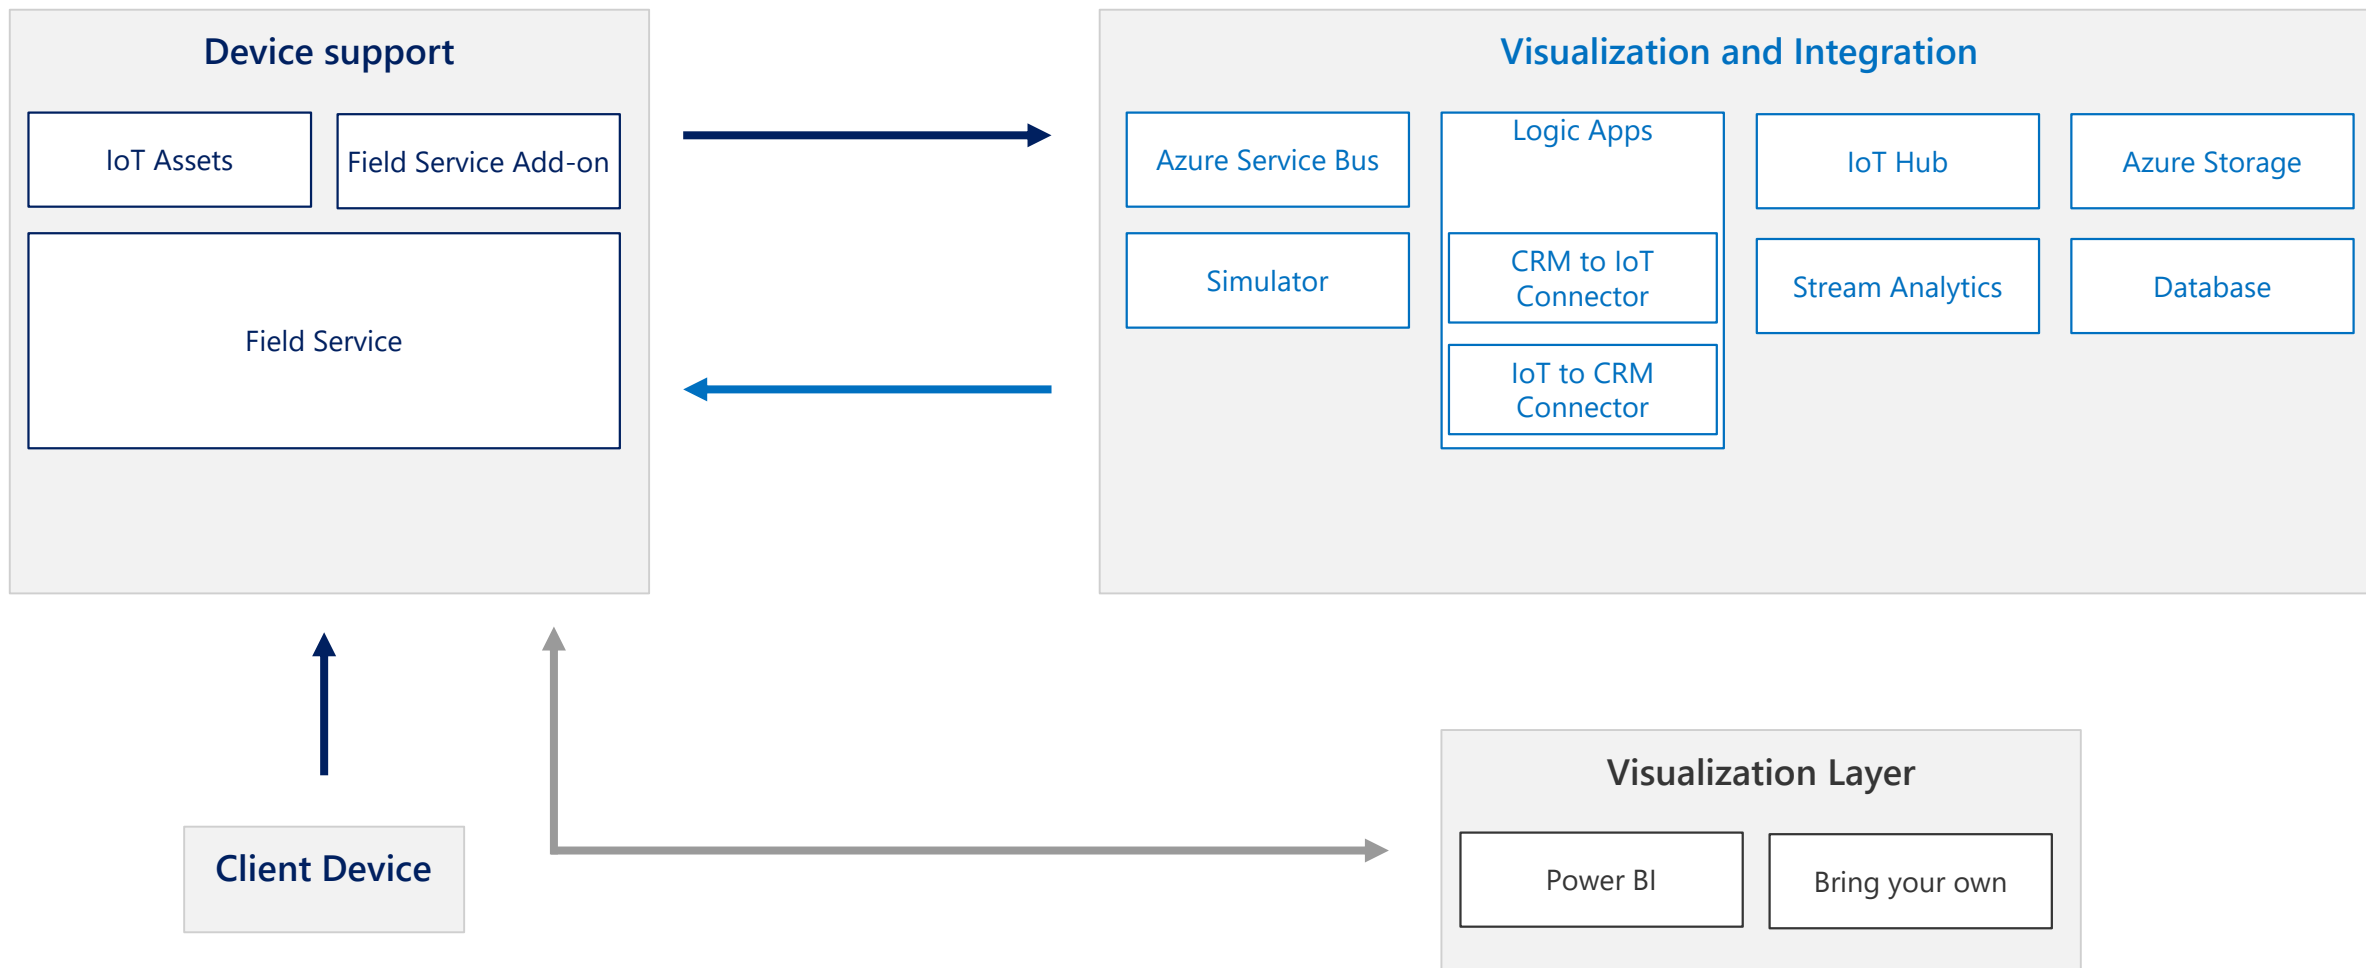

Initial Release

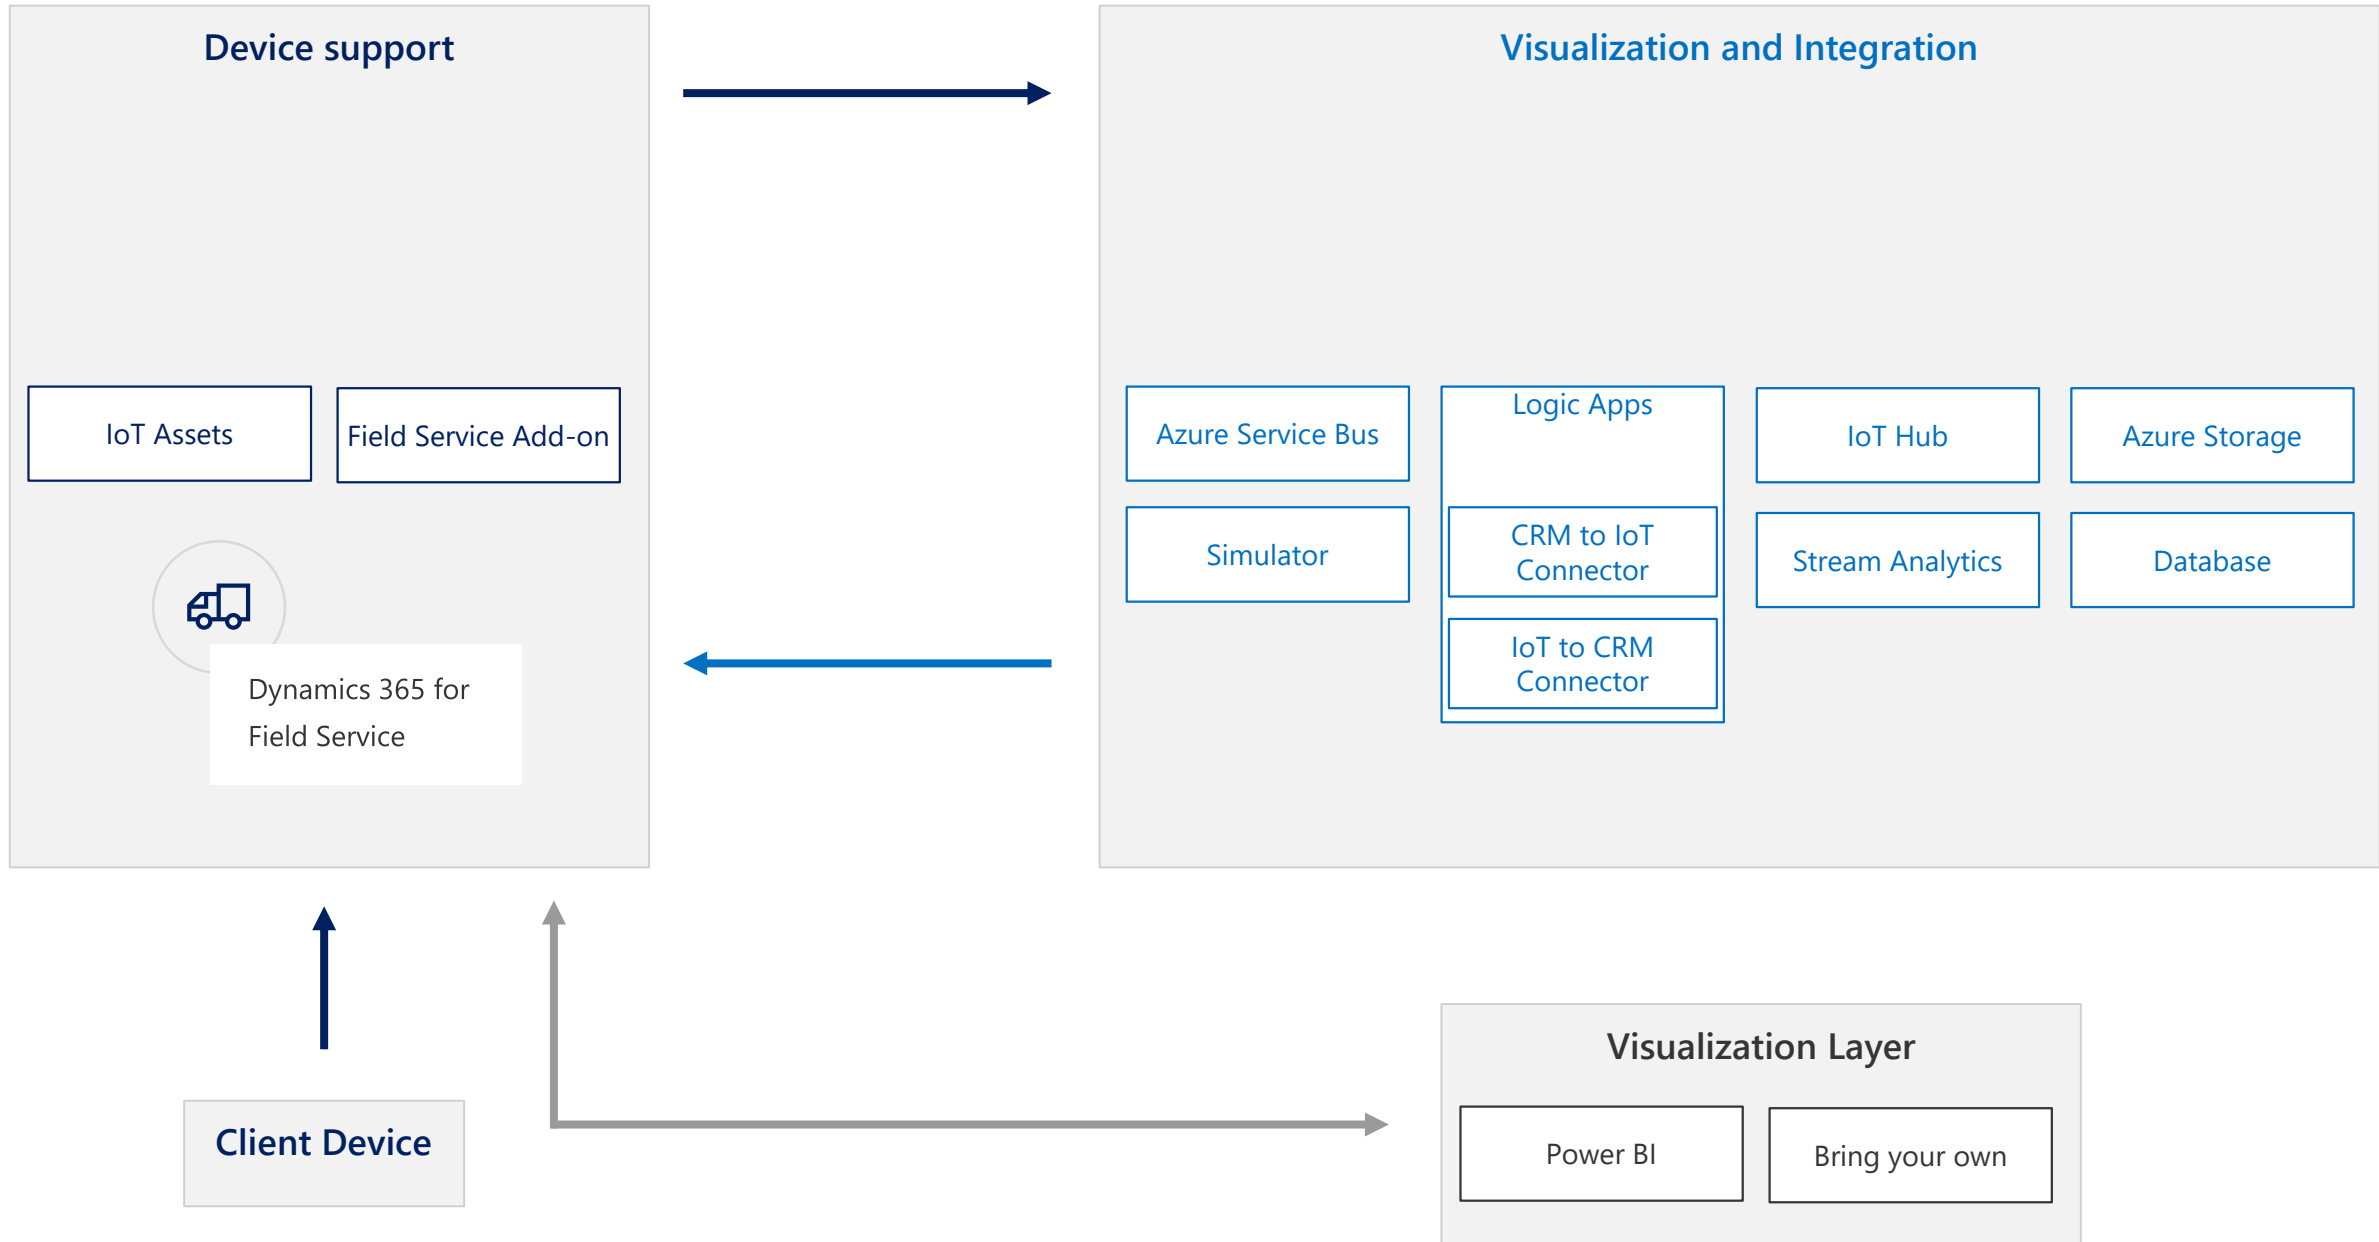

v1.0.18118.1

April 30th, 2018

Upgrade Feature

API Connections

API Connections are used to connect Logic Apps or Azure Functions to SaaS services, such as Office 365. It contains information provided when configuring access to a SaaS service.

Service Bus

Connect to Azure Service Bus to send and receive messages. You can perform actions such as send to queue, send to topic, receive from queue, receive from subscription, etc.

Dynamics 365

Allows us to include a connector in our Logic Apps to generate Dynamics as well receive data from Dynamics.

Azure Storage

Storage Account

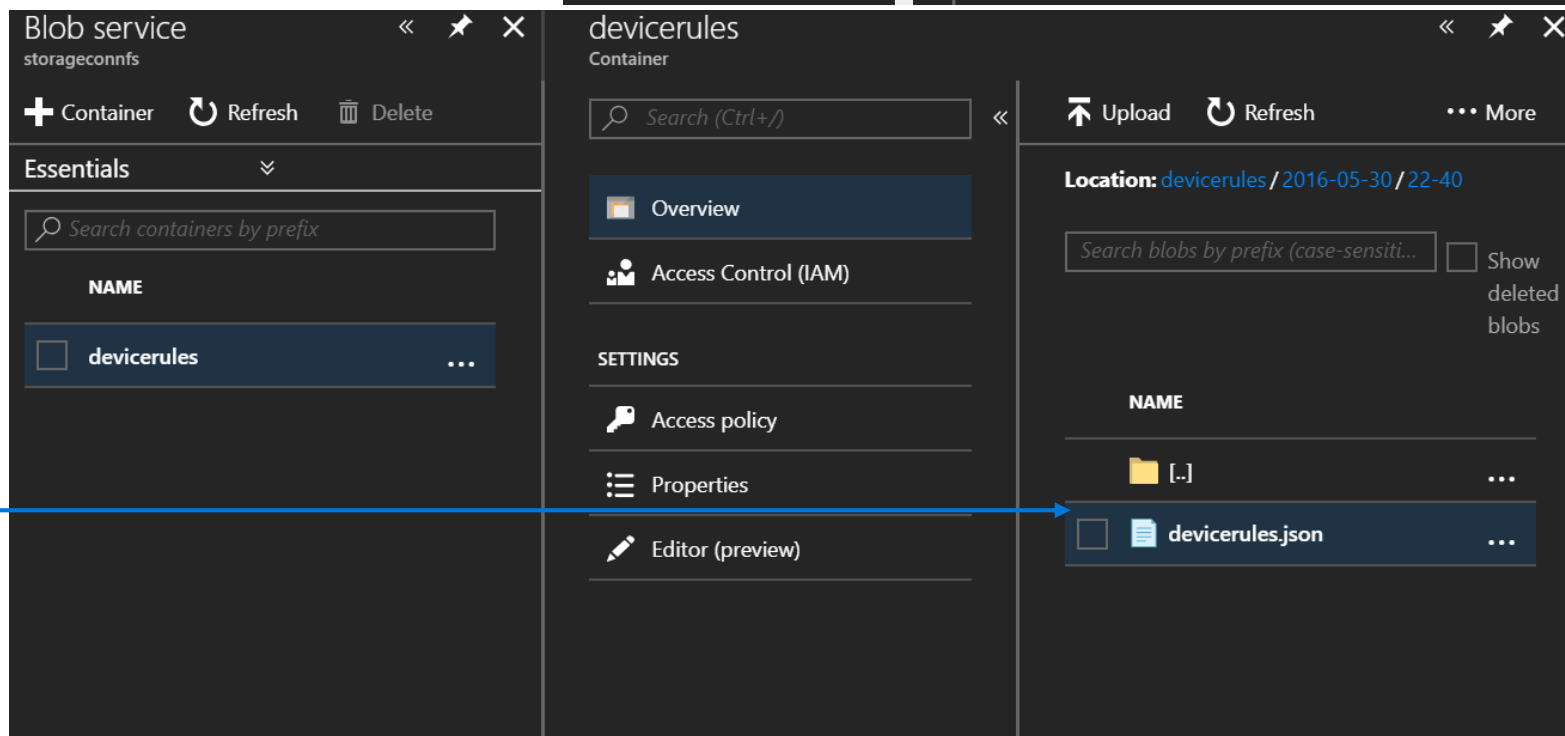

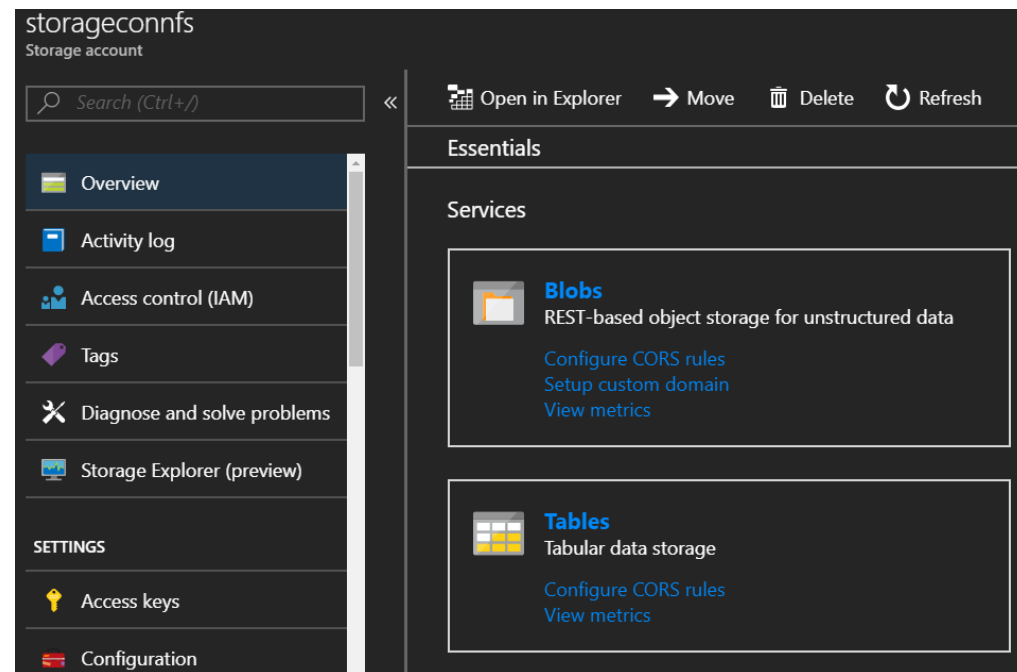

DevicerulesBlob

The Storage Account contains only a DevicesRulesBlob.

This Blob has a JSON payload defining our temperature threshold for IoT temperature readings.

devicerules.json

```
[
  {
    "DeviceType": "Thermostat",
    "Temperature": 70.0,
    "Humidity": null,
    "TemperatureRuleOutput": "AlarmTemp",
    "HumidityRuleOutput": null
  }
]
```

App Service Web App

Thermostat simulator

IoT data using Stream Analytics

The job takes an IoT Stream (Temperature and Humidity data) and DevicesRulesBlob (contains a JSON payload defining our temperature threshold for when to send Alerts) as inputs.

The job sends a message to the AlertsQueue based on the Query and the threshold from the DevicesRulesBlob's devicerules.json file.

13 WHERE
14     Ref.Temperature IS NOT null AND Stream.Temperature > Ref.
  
```

Monitoring

Resource utilization

Stream Analytics Alert Threshold

Our job takes our IoT Stream (Temperature and Humidity data) as input and a DevicesRulesBlob (contains a JSON payload defining our temperature threshold for when to send Alerts)

Our job sends a message to the AlertsQueue based on our Query and the threshold from our DevicesRulesBlob.

Notice from this we can tell our temperature threshold for this Connected Field Service Add-on solution is 70.0°F out of the box.

And this threshold is referenced in the **JOIN** to the DevcieRulesBlobm, allowing us to use the **WHERE** clause defining an alert as a temperature from our IoT Hub data stream

STREAM ANALYTICS QUERY

```
WITH AlertData AS
(
SELECT
    Stream.DeviceID,
    'Temperature' AS ReadingType,
    Stream.Temperature AS Reading,
    Stream.EventToken AS EventToken,
    Ref.Temperature AS Threshold,
    Ref.TemperatureRuleOutput AS RuleOutput,
    Stream.EventEnqueuedUtcTime AS [Time]
FROM IoTStream Stream
JOIN DeviceRulesBlob Ref ON Ref.DeviceType = 'Thermostat'
WHERE
    Ref.Temperature IS NOT null AND Stream.Temperature > Ref.Temperature
)

SELECT data.DeviceId,
    data.ReadingType,
    data.Reading,
    data.EventToken,
    data.Threshold,
    data.RuleOutput,
    data.Time
INTO AlertsQueue
FROM AlertData data
WHERE LAG(data.DeviceID) OVER (PARTITION BY data.DeviceId, data.Reading,
    data.ReadingType LIMIT DURATION(minute, 1)) IS NULL
```

DEVICE RULES JSON

```
[
  {
    "DeviceType": "Thermostat",
    "Temperature": 70.0,
    "Humidity": null,
    "TemperatureRuleOutput": "AlarmTemp",
    "HumidityRuleOutput": null
  }
]
```

IoT Stream to Alerts Queue

rgconnectedfieldservice96e5071ebdd64bf88

AlertsQueue

Where the threshold rule is configured – this is what determines what is an alert and worth sending to CRM.

```
WITH AlertData AS
(
  SELECT
    Stream.DeviceID,
    'Temperature' AS ReadingType,
    Stream.Temperature AS Reading,
    Stream.EventToken AS EventToken,
    Ref.Temperature AS Threshold,
    Ref.TemperatureRuleOutput AS RuleOutput,
    Stream.EventEnqueuedUtcTime AS [Time]
  FROM IoTStream Stream
  JOIN DeviceRulesBlob Ref ON Ref.DeviceType = 'Thermostat'
  WHERE
    Ref.Temperature IS NOT null AND Stream.Temperature > Ref.Temperature
)

SELECT data.DeviceId,
data.ReadingType,
data.Reading,
data.EventToken,
data.Threshold,
data.RuleOutput,
data.Time
INTO AlertsQueue
FROM AlertData data
WHERE LAG(data.DeviceID) OVER (PARTITION BY data.DeviceId, data.Reading,
data.ReadingType LIMIT DURATION(minute, 1)) IS NULL
```

PowerBI SQL

Optionally deployed to send telemetry to SQL DB which is used for PowerBI visualizations of the device health.

```
WITH TelemetryData AS
(
  SELECT
    Stream.DeviceID,
    'Temperature' AS ReadingType,
    Stream.Temperature AS Reading,
    Stream.EventToken AS EventToken,
    Ref.Temperature AS Threshold,
    Ref.TemperatureRuleOutput AS RuleOutput,
    Stream.EventEnqueuedUtcTime AS [Time]
  FROM IoTStream Stream
  JOIN DeviceRulesBlob Ref ON Ref.DeviceType = 'The
'),
MaxInMinute AS
(
  SELECT
    TopOne() OVER (ORDER BY Reading DESC) AS telemetryEvent
  FROM
    TelemetryData
  GROUP BY
    TumblingWindow(minute, 1), DeviceId
)

SELECT telemetryEvent.DeviceId,
telemetryEvent.ReadingType,
telemetryEvent.Reading,
telemetryEvent.EventToken,
telemetryEvent.Threshold,
telemetryEvent.RuleOutput,
telemetryEvent.Time
INTO PowerBISQL
FROM MaxInMinute
```
